

RAMCO INSTITUTE OF TECHNOLOGY
Department of Electronics and Communication Engineering
Academic Year: 2018- 2019 (Even Semester)

Innovative Practices Description

UNIT IV (SPECIAL SEMICONDUCTOR DEVICES)

Degree, Semester& Branch: II Semester B.E. ECE A

Course Code & Title: EC8252 & Electronics Devices

Name of the Faculty member: Mr.T.Ramprakash

Name of the Topic: LDR

Name of the Innovative Practice: Demonstration

Description:

The working principle of LDR is that it gives less resistance in high light intensity and high resistance in low light intensity. It gives high resistance in dark or night and low resistance in day or light. So It thought it would be more interesting if I demonstrated this concept using a real time example. So I planned to design an Automatic Street Light using LDR. I connected the following circuit in the breadboard and took to the class and demonstrated in the class. When I closed the LDR with hand, it was dark so that the LED glowed and when I removed the hand from LDR, the surrounding was bright and so the LED was off. While demonstrating this demo, students felt so existed and very well understood the concept of LDR and was able to draw the graph of LDR by themselves as they clearly understood the concept of LDR.
