

**RAMCO INSTITUTE OF TECHNOLOGY**  
**Department of Electronics and Communication Engineering**  
**Academic Year: 2018- 2019 (Even Semester)**

**Innovative Practices Description**

**UNIT III (HASH FUNCTIONS AND DIGITAL SIGNATURES)**

**Degree, Semester & Branch:** VIII Semester B.E. ECE A & B

**Course Code & Title:** CS6701 Cryptography and Network Security

**Name of the Faculty member:** Mr.T.Ramprakash

**Name of the Topic:** MD5

**Name of the Innovative Practice:** Demonstration

**Description:**

MD5 is the abbreviation of 'Message-Digest algorithm 5'. The MD5 algorithm is used as an encryption or fingerprint function for a file. Often used to encrypt database passwords, MD5 is also able to generate a file thumbprint to ensure that a file is identical after a transfer for example. An MD5 hash is composed of 32 hexadecimal characters. After teaching the algorithm beyond the MD5 technique, I demonstrated an online MD5 Encryption which will encrypt the given word to the cipher text. I again copied the cipher text and opened an online MD5 decryption and typed the cipher text over there. I decrypted the message and it showed me the actual plain text which I encrypted. Students were more interested in watching such demonstration.

The screenshot shows the MD5Online website. At the top, there's a green header with 'MD5Online' on the left and 'HASHS IN THE DATABASE 1,154,869,846' on the right. Below the header is a dark navigation bar with links: 'Home', 'MD5 Encryption', 'MD5 Decryption', 'Bulk MD5 Decryption', and 'Premium & API'. A Google ad banner is visible below the navigation bar. The main content area is titled 'MD5 Encryption' and contains a text input field with the placeholder 'Enter a word here to get its MD5 hash :'. Below the input field is a green 'Crypt' button. At the bottom, it displays the result: 'The MD5 hash for Hi how are you is : 81d400b183505bfff96b6c10873a5507f'.
