

RAMCO INSTITUTE OF TECHNOLOGY

Approved by AICTE, New Delhi & Affiliated to Anna University

NAAC Accredited with 'A+' Grade & An ISO 9001: 2015 Certified Institution

NBA Accredited UG Programs: CSE, EEE, ECE and MECH

Department of Computer Science and Engineering

Academic Year 2025– 2026 (Odd Semester)

Degree, Semester & Branch : VII Semester B.E CSE
Course Code & Title : AI3021 & IT in Agricultural System
Name of the Faculty member : Mrs. S. Vijaya Amala Devi, AP / CSE

Innovative Practice Description

- **Unit / Topic:** Unit III/ Agricultural Systems Management /Project Scheduling
- **Course Outcome:** CO3
- **Topic Learning Outcome:** 28
- **Activity Chosen:** Wisdom of Another
- **Justification:**
 - ❖ “Wisdom of Another” is a reflective learning strategy that allows students to adopt another team’s design thinking and critique it constructively. It enhances critical thinking, reinforces domain knowledge, and promotes empathy in collaborative learning.
 - ❖ Project scheduling involves complex planning, task sequencing, and resource allocation. By leveraging the experience and insights of peers or experts, students can understand practical challenges in agricultural project management, such as crop rotation timing, irrigation scheduling, and labor allocation.
- **Time Allotted for the Activity:** 40 Minutes
- **Details of the Implementation:**
 - The instructor began the session by introducing project scheduling techniques in agricultural systems, emphasizing their importance in planning agricultural projects, managing tasks, and ensuring timely completion of activities such as crop planting, irrigation scheduling, and harvest planning.
 - Students were provided with pre-class materials on Gantt charts, CPM, PERT, and sample case studies three days (11.9.2025) before the session and were asked to review these resources and note examples of project planning they had observed or experienced, such as crop cycle scheduling, labor coordination, or irrigation implementation.
 - During the class, students were organized into 15 groups, and each student shared the example they had prepared. Volunteers presented their experiences, allowing the class to learn from the practical insights of their peers, demonstrating the principle of “Wisdom of Another.” Following this, peer narrators like Ms. Poojasri explained their examples in detail, highlighting challenges and solutions in project scheduling. The instructor guided the discussion, helping the class extract key lessons from each shared experience.

- After the discussion, students engaged in group work to apply the shared insights. Each group was assigned an agricultural project scenario, such as multi-crop plantation or irrigation management. Using the pre-prepared Gantt chart template, groups like teams created project schedules that incorporated lessons learned from their peers, such as aligning labor availability with peak tasks and accounting for irrigation dependencies.
- Next, selected groups presented their project schedules to the class, explaining how they applied insights from their peers' experiences to optimize task sequencing and resource allocation. The instructor provided targeted feedback, corrected misconceptions, and emphasized best practices in project scheduling, reinforcing the connection between theoretical techniques and practical applications.
- Finally, students were asked to refine their schedules as an out-of-class task and submit a short reflection, noting how they applied the lessons learned from peers. This approach not only enhanced understanding of project scheduling concepts but also promoted active learning, collaboration, and critical thinking, allowing students to connect theory with real-world agricultural project management.

CO – PO / PSO mapping:

CO	PO1	PO2	PO3	PO9	PO10	PO12	PSO3
CO4	3	3	3	3	3	3	3

(1 – Low 2 – Moderate 3 – High)

• **PO / PSO mapped:**

Innovative practice	PO1	PO2	PO5	PO9	PO12	PSO2
	3	3	3	3	3	3
Justification for correlation	Student able to apply the knowledge of IT in Agricultural systems management	Students able to identify and analyze the managerial overview of agricultural systems management.	Student able to create and apply the IT tools for optimizing the use of resources	Students able to function effectively as a team in project scheduling for Agricultural systems.	Student able to explore emerging IT techniques in agricultural system management.	Students able to integrate IoT-enabled monitoring with cloud-based decision tools for efficient field operations management.

Reflective Critique:

❖ ***Discussing with students:***

- The activity prompts students to analyze and evaluate the information presented by peers, fostering deeper intellectual engagement and helping them make connections between theoretical concepts and practical applications.

❖ ***Benefit of the practice:***

- The implementation of peer teaching in project scheduling encourages peer-to-peer learning and critical analysis, allowing students to discuss and evaluate different approaches to planning agricultural projects.
- It also improves conceptual modeling, as students receive hands-on correction and suggestions from peers and the instructor while creating Gantt charts or CPM schedules. Additionally, the activity enhances communication skills, as learners explain their ideas, justify their scheduling choices, and engage in collaborative discussions within their teams.
- This combination of analysis, practical application, and discussion fosters a deeper understanding of project scheduling concepts and promotes active, student-centered learning.

❖ ***Challenges faced in implementation:***

- During the project scheduling activity, **time constraints** made some students feel pressured while discussing and presenting their project schedules, which limited the depth of their analysis and reflection.
- Additionally, some students were unfamiliar with project scheduling concepts, such as task sequencing, Gantt charts, or resource allocation, and required extra guidance from the instructor or peers to complete their tasks effectively.
- Finally, students sometimes needed prompting to provide constructive and specific feedback to their classmates, highlighting the importance of guidance in developing

effective peer evaluation skills.
