To

The President,
RAMCO Group Textile Division,
Rajapalayam – 626 117.

Dear Sir,

Sub: Permission for Internship Training - II Year ECE students – Reg.

I wish to inform you that, as a part of the curriculum, all students are required to undergo internship to a few industries of repute. We feel it will be fruitful, if the students with academic background have a glimpse of the industry in order to have a better appreciation of practical applications of theory.

In this context, we would like to send about Twenty Five students of II year Electronics and Communication Engineering for Internship from 25.07.2022 to 30.07.2022 in RAMCO Group Textile Division, Rajapalayam. I request you to kindly accord the necessary permission for the above internship and arrange for guiding the students.

We assure you that our students will observe the rules and regulations that are prescribed by your industry for the visitors and will in no way disturb the functioning of the industry during their visit.

We shall be grateful to you for a favorable response. Herewith we have furnished the list of students.

Thanking you,

PRINCIPAL

Dear Dr. Gopinath Sir & Dr. Deivanayagam Sir

We are happy to provide the 6 day Hands-on based workshop on Machine Learning using Python.

Please provide us the list of students who are interested to participate.

We will provide certificate of completion at the end of the Workshop.
Please find the attached PDF which has all details of the workshop.

Eligibility: All aspiring Electronics ECE, EIE, Computer Science (CS), Information Technology (IT) Engineering Branch, M.Tech, MCA Students entering into 2nd Year to Final Year Students can participate in this training Program

Certificate: Certificate of Merit for all the workshop participants will be awarded.

Duration: 6 Days - The duration of this workshop will be six consecutive days, with 6-7 hour session with hands-on each day.

Regards
Workshop Team @ V3Analytics

Aravind Herbal, Rajapalayam.

Three Faculty members (Dr.A.Azhgou Jaisudhan Pazhani, ASCP/ECE, Mr.B.Kannan, AP(SG)/ECE and Mr.P.Gunasekaran, AP/ECE visited Aravindh Herbal Labs Pvt. Ltd., Rajapalayam and identified 8 industrial problems to carry out consultancy works.

Annai Aravindh Herbals, an ambitious venture initiated with the guidance of Dr.P.Rajalingam and Dr.Vijayalakshmi, strives earnestly to develop herbal medicines in a more scientific way. From sourcing naturally grown herbs from dedicated herb farms to processing in a natural yet scientific method, we go a long way to make sure the raw material is most suited for production. Our strict adherence to control measures on the nature of soil content, fertilizer sources, and method of pest control, ensure the herbs to be medicine ready.

Three Faculty members Dr.A.Azhgou Jaisudhan Pazhani, ASCP/ECE, Mr.B.Kannan, AP(SG)/ECE and Mr.P.Gunasekaran, AP/ECE visited Aravindh Herbal Labs Pvt. Ltd., Rajapalayam on 30.11.2021 and discussed with Dr.Aravindh. We visited the processing, manufacturing and packaging section. We identified 8 industrial problems to carry out consultancy works. The component cost involved in the project work, we can recover from Aravind Herbals after successful implementation.

Greetings from Ramco Institute of Technology!!!

Dear Mr K S P Janardhan Babu sir

I am Mr G Sivakumar working as an Assistant Professor/ECE in Ramco Institute of Technology. We planned to conduct a webinar titled "Human Values" in association with the IETE students chapter. Objective of this webinar is to clarify how human values are deeply essential to nourish the moral capabilities in the students and ultimately in society in a positive way.

We invite you to be a resource person for the webinar on "Human Values". The webinar is scheduled to take place on Date: 04.03.2023 & Time :3.00 PM to 5.00 PM Venue : Online - Google Meet. Your valuable insights and experience would greatly benefit our students. Thank you for considering our invitation, and we look forward to hearing back from you soon.

Best regards,

Mr.G.Sivakumar AP/ECE

Certificate:

Project Review (Batch 2019-2023):

The progresses of project are mentioned periodically by conducting three reviews with the help of project review committee. The project review is done during each internal assessment period. Apart from this the project members meet the project supervisor during project days and maintaining a project monitoring note. In case of external projects, i.e., project done in the industry, the students have to update the progress of the project to the concerned project supervisor.

In review 2, industry experts are included as one of the project review member. Based on their suggestion students enhance their project.

Dr.V.Lingasamy, The Manager (Research and Development), Rakuten Mobile Inc., Bangalore and Mr.Manikandan Subramanian, Managing Director, Geons Logix Pvt. Ltd., Madurai are acted as review members for project review II (Batch 2019-2023).

Respected Sir

Sub: Requisition for granting permission to industrial visit-reg

As a part of academic process we wish to undergo industrial training in Aavin, TamilNadu Co-Operative Milk Producers' Federation Limited, VNR DCMPU, Virudhunagar. We request you to kindly give permission for undergoing industrial Visit in the above mentioned industry from 02.01.2023 and 03.01.2023.

Thanking you

29.12.2022

Faculty Members reached the factory by 9.30 A.M on 02.03.2022. Ms.Rajeswari, Aavin, TamilNadu Co-Operative Milk Producers' Federation Limited, TamilNadu Co-Operative Milk Producers' Federation Limited, VNR DCMPU, Virudhunagar, welcomed us and explained about the traditional values of company. He also explained about how the production is carried out from the milk coming from the Bulk Milk Chillers(BMCs). After that we visited each and every section of the milk and milk product processing.

Milk Processing

They are getting huge milk from the Bulk Milk Chillers(BMCs) and checking their quality by analysing the proportions of following compounds such as lactose, sucrose, Various adulterants water and other quality and quantity related mixers by using a Lactoscope FTIR Advanced (FTA) Instrument.

The dairy industry is divided into two main production areas:

- 1.The primary production of milk on farms for the production of milk for human consumption.
2. The processing of milk—with the objective of extending its saleable life. This objective is typically achieved by (a) heat treatment to ensure that milk is safe for human consumption and has an extended keeping quality, and (b) preparing a variety of dairy products in a semi-dehydrated or dehydrated form (butter, hard cheese and milk powders), which can be stored.

Milk Production

The processes taking place at a typical milk plant include:

- Receipt and filtration/clarification of the raw milk
- Separation of all or part of the milk fat (for standardisation of market milk, production of cream and butter and other fat-based products, and production of milk powders)
 - Pasteurisation
 - Homogenisation

- Deodorisation
- further product-specific processing
- Packaging and storage, including cold storage for perishable products
- Distribution of final products

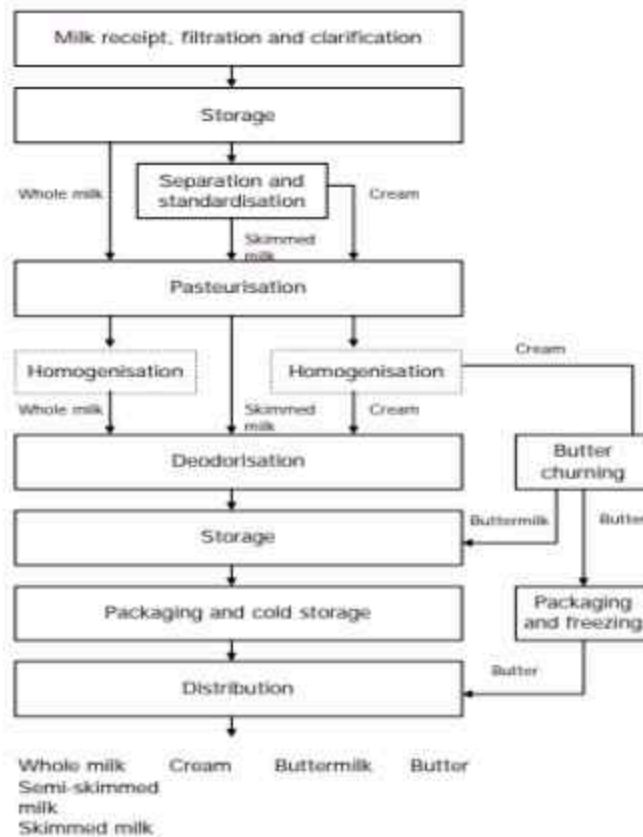

Figure 1.Flowchart showing Milk and milk product Processing

Getting raw milk from tankers

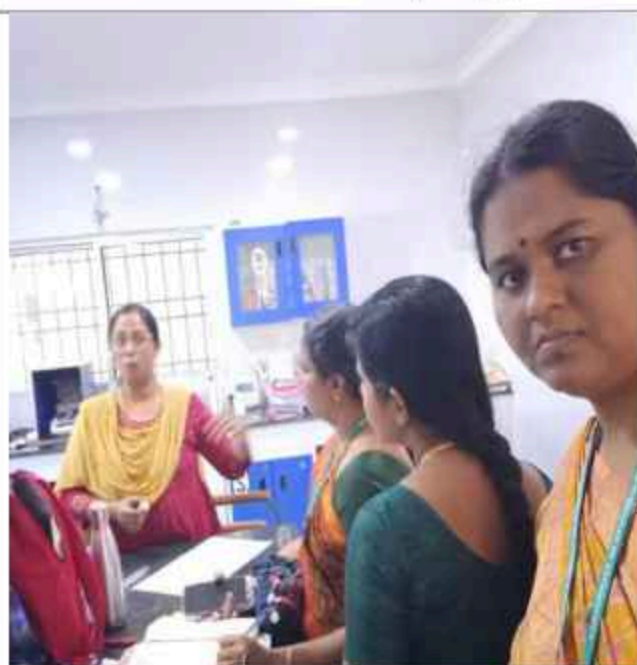

Heating test and immediate increasing temperature from 5 deg celsius to 28.5 deg celsius

FTA Instrument to check all quality parameters

FTA Visualization

Moisture checking

Pasteurisation and Homogenisation Tankers

Milk Products Processing

Ghee making

In this process, unsalted or white milk butter is used as the raw material. Butter blocks are melted in a butter melter from 60°C to 80°C. Melted butter is pumped into the ghee boiler, where final heating gets done by using steam as the heating medium.

Now the steam pressure is increased to raise the temperature. A certain amount of scum is formed on the top of the product's surface, which is removed frequently

with the help of a holed scoop. At this stage of the ghee manufacturing process, the typical ghee aroma gets felt. The final heating temperature is adjusted at $114\pm 2^{\circ}\text{C}$. The oil filter filters produced Ghee into the settling tank.

Checking the temperature of the butter and loading it in the ghee making tanker.

Ghee making sections with tankers for hierarchical process.

Paneer manufacturing

Paneer manufacture involves the coagulation (1 per cent citric acid solution) of milk proteins to form curd. During this process large clumps of proteins are formed in which fat and other colloidal and dissolved solids get entrapped. The coagulation of milk occurs when pH of milk reaches 4.6 which is the isoelectric point of its major protein, casein.

It consists of one horizontal blades frame and guided by bushes and connected to pneumatic cylinder for up and down operation. Another horizontal Servo Cylinder attached to index Paneer Accurately. All blades and structural frame are of S.S. 304 and all blades are Teflon coated

Paneer Making machine

Paneer stiffing and cutting machinery with adjustable screw gauge

Milk Beda and kulfi manufacturing

MilkPeda is prepared by thickening milk in a huge pan by heating milk, it can be done by applying high temperature in connecting valve attached with the beda making machine, adding sugar at 50% condensed state and adding cardamom at the stage of removal and packed in 100g and 250g after pressing with mould, whose shelf life 7 days. For 80 litres of milk they can able to produce 22kgs of milk beda using machine given below. They are frequently releasing steamed water through the valve. Below is the milk peda making stainless steel pan with semi automatic steamer based operation.

Milk peda making machine

Kulfi making machine

Badam milk making

Packet sealing machine

Ghee packaging machine

Cans made of tin plate are used for sweetened condensed milk, evaporated milk, canned Rasogolla and canned gulabjamoons. The cans open at the back are loaded into the machine which fills the product in to the cans. Then the lids are applied and closed by either simple or double seaming depending on the product.

Cans with seam-on lids are also used for cream, ghee and milk powder. Aerosol cans are used for the packaging of whipped cream. In these, the product is filled with a propellant which is under pressure. Flat bottomed collapsible tubes made from aluminium are used for packing cream. After the product is filled from the back of the tube, the head space in the tube is filled.

with inert gas and the tube is then closed by folding. Polyethylene collapsible tubes are presently used for packing cheese spread/cheese food.

Ghee filling machine filling ghee with prescribed quantity in a bottle in close it with lid using motor.

Outlook of Ghee filling and packaging machine.

Milk packaging Machine

The forming plates rolled the flat film in to tube a certain band of overlap. Within the tube is the fluid filling pipe enveloped. The tube then passes over to vertical seal jaws that are engaged and disengaged with the help of an air operated piston, or in machines by mechanical means.

Over wrapping the product with a film or foil is commonly employed for cheese and butter. Generally, these machines work as the push – through principle i.e. the portion to be wrapped is pushed onto the film. In these machines, a measured amount of foil or film is pressed by a piston through a folding channel into a mould. The product shape that is generally packed is either rectangular or triangular. After the piston is drawn, the product is filled into the wrapper, situated in the mould by means of a dosing device. The wrapper is finally folded by the folding equipment. The finished pack is pushed out of the mould.

For milk packing in a wrapper ,Loading wrapper in the loader placed behind the packaging machine.

Configuring packaging process for prescribed litres in the loaded wrapper.

Getting the filled packet from the packing machine.

Storing packets in the vessels and keep it in the cooling chambers for supply.

Areas identified for project during visit:

- ✚ Automation can be done for maintaining the quality of milk in the tanker carrying , milk from Bulk Milk Chillers.
- ✚ Automation can be checking the quality of temperature of the butter to load in butter ghee making boiler to manufacture ghee by using temperature sensor and Arduino

- Automation can be incorporated for large washing the cane or vessels to avoid manual work load and thereby providing hygienic environment.

Finally the team completed the visit by 5:00 P.M on 03.12.2022 with the assurance to provide the automation to the identified area, the team left the Aavin, TamilNadu Co-Operative Milk Producers' Federation Limited, Virudhunagar, Tamilnadu.

Industry Visit

05.01.2023 to 06.01.2023

Report

at

SUGAPRIYA MINERAL WATER,
6/24 C, Pillayarnatham,
Srivilliputtur - 626 125.
Tamil Nadu.

Faculty Members:

1. Mrs.S.Jeeva

Assistant Professor, Department of ECE

2. Mrs.G.Subhashini

Assistant Professor, Department of ECE

3. Ms.R.Chandralekha

Assistant Professor, Department of ECE

Sugapriya Mineral Water is one of the leading water supply company. Sugapriya Mineral Water is an Experience of Goodness with every sip it means you Say "Pure-Enjoy" Faculty Members reached the Industry at 9.00 am. PRO of the Industry welcomed us and explained about the traditional values of their Industry with photos. He also explained about history of the industry and the eminent persons visited the industry from inception to recent days.

Factory's exterior

Faculty members explained about the purpose of visit such as to know about the step by step process of water treatment, water filling and water purification, Water bottle and cap manufacturing, industrial problem identification and placement opportunities for our students. Industry head accepted Faculties request and allotted two incharges (Ms.P.Kalaiselvi, Chemist and Mr.P.Seenivasan, Technical In-charge) for guiding the faculty members.

Guiding Faculty (Ms.P.Kalaiselvi)

Faculty members Visited the Bottle Filling Unit

First, Incharges take us to show the overall process Reverse Osmosis purification unit. They explained about each and every step of processing sequence of filtration that removes ions, unwanted molecules and larger particles from raw water.

They have explained about Filter Salt particles and suspended matter, absorb chlorine and any odour, taste and color, pesticide residue, filter smaller particles, bacteria and virus of 5 micron & 10 micron, separate organic compounds microorganisms and virus, attack the microorganisms by damaging the DNA and disable the reproduction, inhibit the growth of microorganisms and improve taste and quality.

Name of the Process in Water Treatment:

- Sand Filter
- Activated carbon Filter
- Pesticide Filter
- Micron Filter
- Reverse Osmosis
- UV Light
- OZonator

Water Treatment Unit

Water Bottle and Cap Manufacturing Process:

Plastic bottle manufacturing takes place in stages. Plastic bottle manufacturers generally use one of four types of plastic to create bottles. Typically, the plastic bottles used to hold potable water and other drinks are made from polyethylene terephthalate (PET), because the material is both strong and light.

Polyethylene Terephthalate is a thermoplastic polymer that can be either opaque or transparent, depending on the exact material composition. As with most plastics, PET is produced from petroleum hydrocarbons, through a reaction between ethylene glycol and terephthalic acid. The PET is polymerized to create long molecular chains, which allows it to produce PET bottles.

Pre-Form of Bottles

The PET bottle blow moulding process works by reheating a pre-moulded PET preform which is

then automatically positioned into a mould. High pressure food grade compressed air is then injected into the preform which expands to form the shape of the mould. Once the plastic has cooled, the bottle is removed and the process repeats. This process is suitable for making a range of bottles 300ml, 500ml, 1L, 2L and 20L Jar in capacity with a range of standard necks available.

Water Filling Process:

1 Bottle Pre-Wash

Bottles are manually inspected to ensure they are in good condition and no contaminants are present. Once inspected, bottles are loaded into the washing and filling line. First step within the line is a warm water interior & exterior pre-wash and sanitize.

Bottle Pre-Wash

2 Bottle Wash

Next, the bottles are rigorously washed on the interior & exterior with food grade detergent.

Bottle Wash

3 Bottle Sterilization

Bottles are then sterilized inside and out with Hydrogen Peroxide to eliminate any chance of bacterial contamination. Hydrogen Peroxide is very effective at killing any bacteria, and leaves no harmful residue.

4 Bottle Rinse and Filling

Purified water with ozone is then used to rinse the bottles before filling. Bottles are filled under pressure with the required amount of water.

5 Capping

Immediately after filling, a tamper proof cap is pressed on the bottle.

7 Coding

Lastly, a date and lot code is printed on the cap of each bottle. The code allows tracing of the exact date and time of bottling.

Coding

It's important to note that all these steps take place in one contained machine under positive pressure to ensure no contamination occurs between steps.

Full View of Pet Jar Manufacturing Unit

Areas identified for project during visit:

1. The implementation of cap assembly and aluminum foil application on the cap requires additional time and labour from the industry peoples. Therefore, this unit needs automation.
2. Automation is needed for sensing the smell on the bottle jar before filling the water on the jar.
3. To remove the bottle cap, automation is required.

Knowledge Dissemination:

The industrial knowledge will be imparted to the students through lecturing to them and helping them with their creative projects.

Signature of the faculty members

Dear Dr.S.Vairaprakash,

I would like to confirm my acceptance of your industrial visit on January 10th and 11th, and I can assure you that our industry will provide significant knowledge during this visit. I hope that this visit will help your team learn things practically through interaction and working methods.

As you are aware, there is a pandemic situation all over the world, so you must follow some basic WHO guidelines.

With regards
Umavivek

First day (10.01.2023), Faculty Members reached the factory Appasamy Associates Pvt.Ltd., Thirubuvanai, Unit –II, by 9.30 A.M Mrs.umamaheswari Vivekananthan, HR Manager Appasamy Associates Pvt. Ltd., welcomed us and described the manufacturing process of the products.

Appasamy Associates is a company based in India that specializes in manufacturing and distributing ophthalmic equipment and surgical instruments. The company was founded by Mr. K. Appasamy in 1978 and has since grown to become one of the leading providers of ophthalmic products in India and several other countries. Appasamy Associates offers a wide range of products for eye care professionals, including surgical microscopes, phacoemulsification systems, intraocular lenses, surgical blades, and various diagnostic instruments. They cater to ophthalmologists, optometrists, and eye clinics, providing them with high-quality equipment and tools for eye surgeries, examinations, and treatments.

The company has a strong focus on research and development and aims to continually innovate and introduce new technologies in the field of ophthalmology. They have a dedicated team of engineers and scientists who work on developing advanced ophthalmic instruments to improve patient care and surgical outcomes.

Appasamy Associates has a widespread distribution network and exports its products to over 100 countries worldwide. They also have a strong presence in the domestic market in India, serving both private and government hospitals and eye care centers.

We visited perimetry manufacturing unit ;

Perimetry is the systematic measurement of visual field function (the total area where objects can be seen in the peripheral vision while the eye is focused on a central point). The two most commonly used types of perimetry are Goldmann kinetic perimetry and threshold static automated perimetry. In Appasamy Associates they manufacturing Goldmann kinetic based perimetry.

- Glaufield Lite AP901CTS
- Glaufield Lite AP901CTS SWAP

Mr.Rajkumar, Service Engineer explained the operation of perimeter and how it used to detect the glaucoma.

A visual field test (perimetry) will detect loss of peripheral vision and provide a map of that loss which will be helpful in diagnosing the cause of the loss.

The highly trained perimetrists at the University of Iowa measure peripheral vision to evaluate glaucoma, neurological diseases, and retinal diseases. They employ manual techniques (Goldmann perimetry) and computer-driven automated techniques (Humphrey and Octopus perimetry). In addition they use a laser scanning device to analyze the structure of the optic nerve (Heidelberg Retinal Tomography).

Then we visited the Auto ref-keratometer section, where Mr. Saravanan, Auto ref unit head, explained how the refractometer detects human vision.

An autorefractor is used to determine an individual's prescription by measuring how light is affected as it reflects through the eyeball. The process is quick and painless for the patient, and the data ensures a baseline to determine the correct eyeglass or contact lens prescription.

First, the autorefractor shines light into the eye, measuring how it changes as it bounces off the back of the eye (the ocular fundus). Then, the patient is shown an image that moves in and out of focus. As reflections are made, several measurements determine when the eye is properly focused. These final figures determine the level of vision correction needed. Unlike many conventional keratometer diagnostic devices, some autorefractors utilize a unique wavefront technology algorithm based on Hartmann-Shack wavefront sensor, which analyzes many focal spots of a light wavefront. It has the ability to measure not just the basic refraction error of a customer, but to obtain a spatially resolved refraction map of the wavefront.

The second day, we visited Appasamy Associates Private Ltd., Thruvandar Koil Unit, where nearly 1200 employees work. Among their ophthalmic product portfolio, they manufacture intraocular lenses (IOLs) and components for ophthalmic equipment.

IOLs are artificial lenses that are implanted into the eye during cataract surgery or refractive lens exchange to replace the natural lens. These lenses help restore vision and can also correct refractive errors such as nearsightedness, farsightedness, and astigmatism. Appasamy IOLs are designed to meet the specific needs of patients undergoing cataract surgery or lens replacement procedures. They offer a range of IOL options with different materials, designs, and features to cater to individual patient requirements and surgeon preferences. The specific types and models of Appasamy IOLs available may vary over time as the company continues to innovate and introduce new products.

Appasamy Associates manufactures several types of intraocular lenses (IOLs) for cataract surgery and refractive lens exchange. These include:

Monofocal IOLs: Monofocal IOLs are designed to provide clear vision at a single focal point, usually distance vision. They are the most common type of IOLs used in cataract surgery.

Toric IOLs: Toric IOLs are specialized IOLs that correct astigmatism in addition to addressing cataracts. They have different powers in different meridians of the lens, allowing for the correction of astigmatism and improvement in overall visual acuity.

Multifocal IOLs: Multifocal IOLs are designed to provide vision at multiple distances, reducing the need for glasses or contact lenses after cataract surgery. They have different zones on the lens surface that enable clear vision at various focal distances, such as near, intermediate, and distance.

Accommodating IOLs: Accommodating IOLs are designed to mimic the natural lens of the eye by adjusting its position in response to the focusing efforts of the eye's ciliary muscle. This allows for some degree of near vision without complete dependence on reading glasses.

Phakic IOLs: Phakic IOLs are implantable lenses that are placed in front of the natural lens of the eye, allowing vision correction without removing the natural lens. They are primarily used for the treatment of high refractive errors that cannot be adequately corrected with glasses or contact lenses.

Finally we meet Mr.R.V. Ravichandran, the director of Operations of Appasamy Associates Group, He ensured that students were allowed to visit the factory and that they ready to provide minimum of six months of internship training to student..

Industry Visit Certificates

An EN ISO 13485:2016
Certified Company

GSTIN : 34AAFA4543Q1ZC
PAN No : AAFA4543Q

Date : 11.01.2023

Certificate of Completion
