

Department of Information Technology

Academic Year 2025 - 2026 (Even Semester)

Semester, Degree & Branch: VI Semester, B.Tech & IT

Course Code & Title: CCS336 & Cloud Service Management

Name of the Faculty member (s): Mrs. P.Ramya, AP/IT

Innovative Practice Description

- **Unit / Topic:** Module I/Cloud Service Deployment Models

- **Course Outcome:** CO1

- **Topic Learning Outcome:** -

- **Activity Chosen:** Mind Map

- **Justification:**

Choosing a **cloud service deployment model** for mind mapping in the classroom is an innovative practice because it bridges the gap between **individual manual effort** and **collective digital intelligence**. While manual drawing promotes deep cognitive focus, transitioning that work to a Public Cloud platform allows students to transform static paper sketches into **dynamic, collaborative ecosystems** that are accessible 24/7 from any device. This model justifies the shift by providing an **infinite canvas** that overcomes physical space limits, integrated AI-driven brainstorming tools that suggest new connections, and a centralized hub where teachers can provide **real-time feedback**. Ultimately, it empowers students to master the tactile "brain-building" phase manually before leveraging the cloud's **on-demand scalability** and seamless version control to refine and present their ideas to a global audience. **Time Allotted for the Activity:** 15 Minutes

- **Details of the Implementation:**

- The time allotted for the topic is 15 Minutes.
- After completion of Cloud service deployment model, the activity was conducted.
- Students are asked to draw the mind map for the given topic within 15 minutes. Each student creates their own mind map on the given topic.

- **CO – PO / PSO mapping:**

CO	PO3	PO5	PO12	PSO1	PSO2
CO1	3	3	2	3	2

(1 – Low

2 – Moderate

3 – High)

• **PO/PSO Mapped:**

Innovative Practice	PO3	PO5	PO12	PSO1	PSO2
	3	3	2	3	2
Justification for Correlation	Students will design cloud-based solutions by selecting the most appropriate deployment model-Public, Private, or Hybrid to meet specific organizational and technical requirements.	Students will learn to utilize Cloud Management Platforms and SaaS/PaaS/IaaS tools to deploy, monitor, and scale applications effectively.	Students will recognize the need for continuous learning as cloud deployment models evolve with emerging technologies like Server less and Edge Computing.	Ability to analyze and choose between on premise and Cloud Deployment Models based on cost-efficiency, data sovereignty, and security constraints.	Proficiency in developing and deploying cloud-native applications that leverage the elasticity and high availability of modern cloud environments.

Figure 1. b Mind map

Reflective Critique:❖ **Feedback of practice from students and other stakeholders:**

- A portion of the class is excited and really benefits from the mind map activity. These students clearly understand the differences between Public, Private, and Hybrid clouds. They can easily explain which model to use for different situations and feel confident using the cloud tools.
- Many other students understand the general "idea" of the cloud but find it hard to put into practice. While they know what a cloud model is in theory, they struggle to map out the technical details—like how to actually set up security or how data moves between a company's server and a Public Cloud. They can talk about the concept, but they get stuck when they have to explain the actual steps needed to make it work.

❖ **Benefit of the practice:**

- Students use visual maps to identify gaps in their deployment strategies, turning technical confusion into a clear, refined understanding of Cloud Infrastructure.
- By exchanging mind maps, students build teamwork skills and learn diverse ways to

solve real-world cloud challenges from their peers.

- *The activity boosts analytical skills, forcing students to weigh factors like cost and security when choosing the best Cloud Service Model.*

❖ *Challenges faced in implementation:*

- A few students were lagging in identifying the precise technical configurations and setup parameters for different cloud deployment models
- Some students mentioned that mapping out all the necessary security protocols and cost-benefit analyses for different models consumed more time than anticipated.
- After the final group discussion, students acquired much better clarity regarding which models to use for specific scenarios, highlighting the value of collaborative review.
