

RAMCO INSTITUTE OF TECHNOLOGY

Department of Mechanical Engineering

Academic Year: 2019- 2020 (Odd Semester)

Degree, Semester & Branch: VII Semester B.E. Mechanical Engineering

Course Code & Title: ME6010-Robotics

Name of the Faculty member: Mr.S.Valai Ganesh, AP/Mech

Date: 06.07.2019

Innovative practice: Incidental Learning

Topic: Robot Parts and their Functions

Use of learning through Incidental Learning

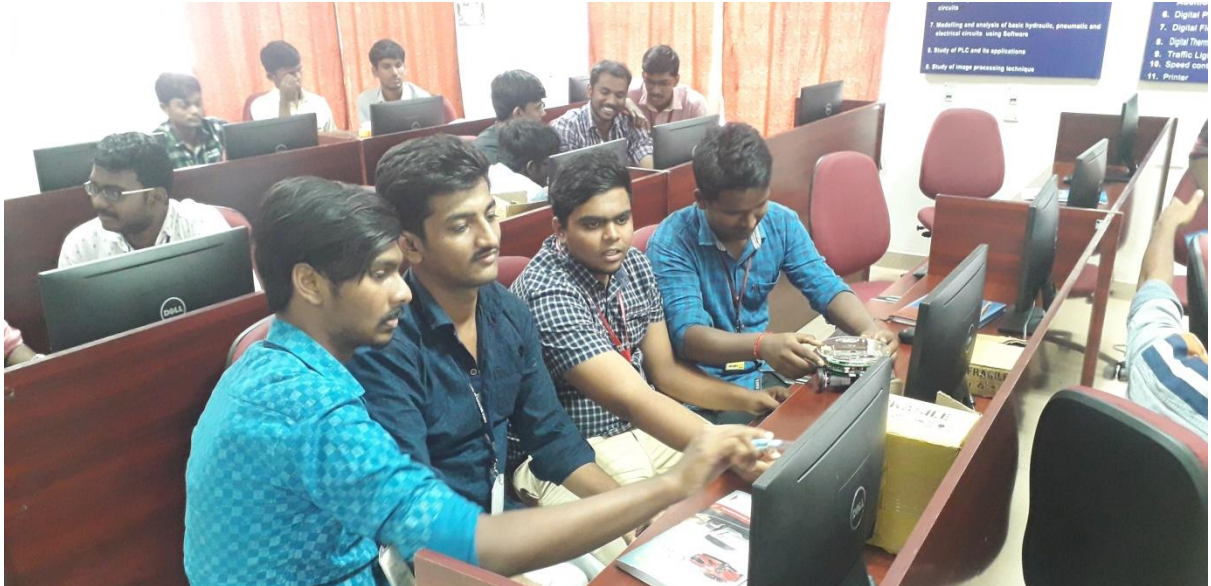

- Incidental learning is unplanned or unintentional learning. It may occur while carrying out an activity that is seemingly unrelated to what is learned.
- Early research on this topic dealt with how people learn in their daily routines at their workplaces
- Unlike formal education, incidental learning is not led by an Instructor, nor does it follow a structured curriculum, or result in formal certification.

Procedure to use Learning through Incidental Learning

- For many people, mobile devices have been integrated into their daily lives, providing many opportunities for technology-supported incidental learning.
- This may trigger self-reflection and this could be used to encourage learners to reconceive what could otherwise be isolated learning fragments as part of more coherent and longer-term learning journeys.

DURING INCIDENTAL LEARNING SESSION

Students searching and discussing about Firebird V Robot and its interfaces

Students Programmed Firebird V Robot in ATMEL Studio Software without aid from the Course Instructor and Technician

SESSION OUTCOMES:

- This makes the students to learn self-programming. (Input and Output devices interfaces to robot)
- This forms the students to work independently in the company without technical support from others.
- It provides opportunities for the students to acquire current technologies.
- It allows students to learn multidisciplinary domain activities.
